PARMORNAD

This work on Construction and Standardization of Achievement Tests in Gujarati language was undertaken by the Psychological Research Institute of the Gujarat Research Society, Bombay. In this, Achievement Tests in Gujarati, Hindi, Airthmetic, History, Geography and Science have been constructed and Standardized for Standards Fifth, Sixth and Seventh. They are based on the Syllabus of the Maharashtra and Gujarat States (Old Bombay State) for the above mentioned standards. They are meant for the Gujarati speaking School going population

The scheme was directed by Dr. (Mrs) M.R. Shah, B.A., M.Ed., Ph.D. (Bom), Ph.D. (London) and Dr. N.N. Shukla, B.Sc., M.Ed., Ph.D.

Shri R.B. Naik, Mrs. Jolly Munshi, Kumari Bhagavati Ghaswala and Kumari Panna Adhvaryu worked as Research Assistants. Shri R.B. Naik worked as the Statistician also.

The study was made possible by a grant from the Minsitry of Education, Government of India.

INTRODUCTION:

inq

One of the most important izactivities of the All India Council for Secondary Education el ter its establishment in 1955 was its efforts in the direction of reforms in Examination and Evaluation. The Bhopal Seminar organised by the Council in February 1956 gave a common platform to some of our leading educationists, secretaries of the Boards of Secondary School Examination of the various states and experienced school teachers to air their views on examination reforms. This was followed by a number of seminars and workshops on educational evaluation and testing for the lectures of the training colleges and the Head-Masters and teachers of Secondary Schools. These seminars were held at different places all over the country. They were conducted by Benjamin Bloom of the University of Chicago under the aegis of the council and have given the lead and definite programme of action for constructing a valid, reliable and objective examination, emphasised with by the University, Education Commission and the Secondary Education Commission. The council also later on decided to set up an Examination Unit. This has been now attached to the Directorate of Extension Programme for Secondary Education popularly known as DEPSE.

The Government of India has been very keen on introducing educational reforms at different levels and in different areas. To enable institutions and individuals to carry on researches and

ovision for ots in the Second

Though the scheme was so ioned in Octsuch provisions is work could not actually be star I d up to Feln secondary Education " table arly known and staff could not be thich grants are given to recognised Professors February 1959 that recognised Universities and institutions to carry on MoA., but. Projects, on problems in Secondary Education.

Gujarat Research Society has been five its inception in 1936. It thought of construction and standardiza. Wition of Intelligence Tests as far back as 1942 and had prepared an incurrence in the society and intelligence of Gujarati speaking population in Bombay. It also encouraged individual efforts for researches on problems in education by granting small research grants to students to carry on researches for their master or doctrate degrees. The keen interest of the Gujarat Research Society resulted in the birth of The Psychological Research Institute in 1954.

This rsychological Research Institute of the Gujarat Research Society submitted a scheme to the Government of India in 1957 for construction and standardization of an Achievement Test battary in Gujarati for all the subjects taught in Stds. V, VI and VII in the Old Bombay State. This scheme was approved and the Government of India was pleased to sanction the scheme vide their letter No. F.11-13/58-SE-1 dated 30th October 1958.

Directors in charge of the Scheme :

Dr. (Mrs) M.R. Shah, B.A., M. Ed., Ph.D. (Bom.), Ph.D. (London)., Hon. Director of the Psychological Research Institute and the then Research Officer, Primary Education of the Bombay Municipal Corporation, and Dr. N.N. Shukla, B. Sc., M. Ed., Ph.D., Full-time Director of the Psychological Research Institute were accepted as the Professors for directing the project.

Investigators:

Though the scheme was someoned in October 1958, the work could not actually be star I dupto February 1959, as suitable and qualified staff could not be produced during the middle of the year. Even in February 1959 the services of only two persons namely (1) Shri L.M.Vyas, M.A., B.T. and (2) Mrs. S.R.Mory, B.A., B.T. could be produced. These two persons also left for better prospects in June 1959. However, it was from June 1959 that a permanent qualified staff was available and the following full fledged staff was appointed. This staff continued to work till the project was complete

Research Assistants:

- 1. Shri Ramanlal B. Naik, B. Sc., M. Ed.
- 2. Mrs. Jolly Munshi, B.A., M.Ed.
- 3. Miss Bhagwati Ghaswalla, B.A., M. Ed.
- 4. Miss Panna R.Adhvaryu, B.A., B.Ed. (1st Class) LL.B.

Part time clerk.

1. Miss Chandrika K. Mehta.

CHAPTER II

Plan of the Work and Item Construction.

The scheme was submitted to the Ministry of Education, Government of India in March 1958 for constructing and standard-izing Achievement Tests for the subjects shown in Table I.

TABLE I

| | ·Subject. | <u></u> | | VII | Total |
|----|------------|---------|--------|-----|---------|
| 1. | Gujarati | 1 | 1 | 1 | . 3 |
| 2, | Hindi | l | 1 | 1 | 3 |
| 3. | Arithmetic | 1, | 1 | 1 | 3 |
| 4. | History | 1. | 1 | ı | 3 |
| 5. | Geography | 1 | 1 | l | 3 |
| 6. | Science | 1 6 | 1 6 | 1 6 | 3 18 |

It was planned so that the work could commence from of the scheme
June 1958, but the official sanction/was received in October
1958. Since, then, all steps necessary to start the work were
immediately taken by the psychological Research Institute, but
that period being the middle of the academic year, qualified
workers suitable for the projects were not available. However,
all possible efforts were made to start the work with whatever
staff was available and the scheme was commenced with only two
persons in February 1959 as mentioned in Chapter I. These two
persons also left the job for better prospect in June 1959 after serving the Institute for a few months only. Because of
this difficulty of non-availability of experienced and qualified
staff in the beginning, it was not possible to start the work
on all the subjects simultaneously. As such the work of item

construction in Geography for standards V, VI and VII and in History for standard VI were taken up in February 1959 so that work of Fre-pilot testing in these tests could be taken up in March and April of the same year.

The work of constructing test items on the remaining - subjects was taken up in hand from June 1959 when the services of the fullfledged qualified and experienced staff were available.

Laying down the objectives and Analysis of the Syllabus. :

The specific objectives on the basis of the general objectives, specific objectives based on the syllabus and instructional objectives for teaching each of the objects mentioned in Table I were first formulated. These have been summerised in some of the welknown books on Achievement Test Construction such as "Measurement and Evaluation in the Secondary School "by Greene H.A., - Jorgensen A.A., and Gerbenich J.R. and "Measuring Educational - Achievement" by Michal W.J. and Carns, "Measurement in To-day's Schools by Ross C.C. and others and hence they are not repeated here.

The syllabus prescribed for standards V, VI and VII in each of the subjects (namely, Gujarati, Hindi, Arithmetic, History, Geography and Science) by the Education Department of the then existing Bombay state was also studied and carefully analysed in the content areas.

Consideration of Relative Weightage to the Different objectives and to the different topics included in the syllabus.

It is obvious that all the objectives laid down for teaching a particular subject in a particular standard and all the topic laid down for a particular topic or a sub-topic of a subject in a particular standard cannot have importance in equal degrees. There are certain topics which are comparatively easy. Naturally they demand less time while teaching and should as a result demand less space in the test. On the other hand there are other topics which are comparatively difficult and need to be stressed more at a particular level. Naturally they demand more time while teaching and

should therefore demand more items in the test. As a natural consequence, therefore, to secure content validity, the different topics and sub-topics must be assigned proper weightage in the tests to be constructed. The weightage was determined by the following methods.

Views of Experienced Teachers.

In actual teaching, the subject teachers devote more period to the relatively more important topics. Hence their rating: would serve as a rough index of relative weightage to the different - topics. The syllabil of different subjects analysed in the content area as mentioned above were given to some experienced teachers in each of the subjects and they were asked to put down what percentage of period they would assign to each of the area while teaching their subjects.

Relative weightage at the Annual Examination:

It is evident that in academic examinations, the teachers would give more weightage to topics which are more important and are of higher values than others. Hence the very teachers who were asked to put down what percentage of periods they would assign to each of the area while teaching the subject were also asked to put down the marks they would allot to these topics at the Annual — Examination.

Analysis of Test Books:

Author of test books who are experts in their subject matter as well as in teaching the subject generally write their test books keeping in their mind the importance of each of the topics and proportionately devote the number of pages to each of the subject areas. Hence the different text books sanctioned by the Education Department of the state in each of the subjects were also analysed and the number of pages devoted to each of the topics and sub-topics were tabulated.

The Blue Print :

From the views of the subject teachers on points discussed above and the analysis of the sanctioned text books, the final weightage was determined with the help of 10 experienced persons including the Directors of the scheme and the Research Assistants. On the basis of this, the number of items on each of the topics in the syllabus in all the subjects was fixed and a Blue Prints for each of the subjects was prepared.

Item Construction:

On the basis of these Blue Prints for each of the subjects, the test items for the 18 tests (namely 3 tests for Gujarati one for each of the standards V, VI and VII; 3 tests for Hindi one for each of the standards V, VI and VII, 3 tests for Arithmetic one for each of the standards V, VI and VII; 3 tests for History one for each of the standards V, VI and VII; 3 tests for Geography one for each of the standards V, VI and VII and 3 tests for science one for each of the standards V, VI and VII) were constructed.

Almost one and half times the total items estimated for the final tests were constructed in the beginning. Thus over 3000 items for the tests were constructed.

The Time scheduled for pre-pilot testing, pilot testing and the final run for each of the tests was then fixed up as shown in Table II. This time schedule was rigidly adhered to, to complete the whole project in time.

Usually tosting work for any try-out should be done after the courses are completed in March and April. However as large number of pupils were to be tested (approximately 36000 to - 40,000 children) the testing had to be done in June and July This was another suitable time when children though had been promoted to the higher classes had not learnt much in these new -- classes and hence were as good as in the previous class at the end of the year when they had completed their courses.

The following Tables give the Teachers rating with respect to the time they would allot to each of the content area in their subjects in the three standards under study.

CONSTRUCTION OF THE TEST ITEMS

Study of Some Existing Tests :

Some standardised tests that were available in the subjects under study were critically studied before the items of the present tests were constructed.

Types of the Tests selected:

objective tests can broadly be classified into two main parts. (1) Recall type tests (2) Recognition type tests. Both these types have their marits as well as limitations. However, it is essential to use all these different types of tests to measure all the four different levels of Knowledge. It seems reasonable to assume that the type of tests used - must be appropriate to the level of knowledge being measured. Tests of Multiple choice and Matching typesappear adequate for the first level of knowledge. Recall tests may be required for the other three levels. . . understanding, evaluation, application and many other aspects of thinking can be measured by recognition tests. *

The following types were selected in the present 18 tests according to the need of the subject and the standard.

- a) Recall typestests.
 - 1) Simple Recall tests.
 - 2) Completion Tests.
- b) Recognition type-tests
 - 1) Multiple-choice tests
 - 2) Matching tests
 - 3) True-false tests.
- c) Figure tests

Each of the above type of tests has its own merits and limitations. All these were bourne in mine while constructing the test items.

^{*} Ross C.C. " Measurement in To-day's School" Printice Hall Inc. 1956 P. 166-167

The Source of Items :

Lindquist Suggests " Text books, course outlines, statement of objectives, tests of essential principles or basic abilities or frequent errors or common misunderstandings, discussion questions and even questions from their tests are likely to suggest useful item ideas " *

In the present experiment the following sources were consulted for item writing :

- Text books on the subjects;
- b) Frequent errors of pupils;
- c)
- Question papers, Standard Tests on the subjects. d)

Text books on the subjects: a)

Text Books on the various subjects for standards V. VI and VII sanctioned by the Education Department of the state were studied critically. Teaching points were noted for item construction.

Frequent errors of the pupils b)

" A second type of material which is likely to stimulate the production of item ideas is provided by the written work of the students themselves. Their expression of ideas on issues and problems may reveal points of difficulty which can be the basis of discriminating test items" (*) Frequent errors of the pupils were noted for item - writing from the following cources.

- Teaching experiences of the Research Assistants l) (They had atleast 3 to 5 years teaching experience in the subject)
- Examination of answer-books of pupils of one or 2) two schools.
- From discursion with some of the experienced 3) teachers.

c) Question papers :

Question papers set at the Terminal and Annual Examination of several schools were also studied.

Lindquist E.F. " Educational Measurement" American Council of Education, Washington D.C. 1955 P.191

(*) Ibid P. 191

d) Standardised Tests

Some standardised tests in the various subjects were also studied.

Review of the items :

The items constructed were reviewed by the Research Assistants and Directors of the scheme from the following view points:

- 1) Technical Points : Principles of measurement.
- 2) Subject matter : a) appropriateness of content.
 - b) Accuracy of the scoring key.
- 3) Editorial quality : a) consistency of the test items.
 - b) avoiding undesirable overlapping.
 - c) accuracy of language.

Two experienced teachers in each of the subjects were requested to review the draft items. Their suggestions were invited. The draft of the items was given to a specialist in the language for checking flaws in the language if any.

Each sub-test contained more than double the number of items. However, to economise space the results pertaining to only those items that were finally selected have been included in this report.

Arrangement of the Text Items.

There are two main methods of arranging the test items.

- 1) Discrete method; (2) Omnibus method.
- (1) Discrete Method:

In this method, the items of the same type are arranged in one sub-test, generally in ascending order of difficulty. All the sub-tests selected are arranged one after another. Every subtest is timed separately.

(2) Omnibus Method:

In this method, all the items are arranged in ascending order of difficulty, irrespective of types. The test as a whole has an over-all time limit.

The Two methods and the present Experiments

The method adopted for the present experiment is a banding of both the methods (i) discrete method and (ii) omnibus method.

The items were arranged according to discrete method, but each sub-test was not timed separately. The whole test was given an over-all time-limit. Administration of the test was made simple. Instructions with worked out examples were given in the begining of each sub-test.

The administrator distributes test-booklets and pupils are asked to fill in the names and other particulars and to read the directions carefully. A test is to be administered within a given over-all time-limit.

.

Once the test items are constructed and reviewed the test constructor is anxious to know how the items would work. The tests were therefore pre-tried. E.F.Lindquist defines the pre-pilot test as "The Preliminary administration of the tentative try-out units to small samples of examinees for the purpose of discovering gross deficiencies, but with no intention of analysing pre-tryout data for individual items." Pre-pilot test can be called a grand rehearsal of the pilot test. In this stage, ombisions, ambiguities or inadequacies in the items or directions may be discovered. The main purpose of pre-tryout are:

- 1. To identify weak or defective items and to reveal needed improvement.
- 2. To determine the difficulty of each individual item.
- 3. To find out major omissions, ambiguities or inadequacles in the directions to examinees.
- 4. To determine the amount of time that should be allowed in the later tryout administration.
- 5. To determine the inter correlation among the items in order to avoid overlap in the item selection.

Administering the Pre-Pilot Tests :

The sub-tests of each of the 18 tests were grouped together and printed on separate sheets.

The Fre-tryout for the test was carried out during the last week of March or the first week of April, 1959 or 1960. The whole procedure was very informal. The sub-tests were administered to pupils under normal conditions in a homely

Lindquist E.F., Editor, "Educational Measurement" American Council on Education, Washington, D.C. 1955, P. 251.

² Ibid P. 250-252.

environment of their own classrooms. The pupils were taken into confidence and attempts were made to collect maximum information and to collect students reactions - every time the tests were administered. They were allowed to ask questions if they did not follow any instructions. All the sub-tests were administered separating one after another during the working hours of the Schools. To have a uniform procedure it was decided that each Research Assistant should

- (1) see that the students fills in his or her name and other information on the right hand top of the sheet.
- (2) take care that no pupil copies from his neighbour.
- (3) record accurately the time (in minutes) taken by every pupil when he submits his sheet.
- (4) note everything which the pupils ask him.
- (5) note the impression of the pupils about the test on the whole.
- (6) give suggestions if there were any.

As the pupils were not familier with and accustomed to such test forms (even in a city like Bombay), it was decided and to read/explain the following instructions to students after distributing the test sheets in the class.

- (1) Please fill in your name and other details carefully.
- (2) This is not an examination. It is simply a test of your knowledge.
- (3) Do not start writing before I ask you to start.
- (4) You have not to write long sentence but you have to answer the questions briefly in a wrod, phrase or number.
- (5) You are given complete direction with an illustration. Please read the same carefully and try the questions accordingly.
- (6) You will be given as much time as you want. However do not stop when you do not know a thing and waste your time. Leave that question and proceed further without wasting time.
- (7) Do not try even to peep in your neighbours' paper.
- (8) When you finish the test-sheet hand-over the same immediately to the supervisor. It is not at all necessary to revise the sheet again as you do in your examination.

Sampling :

Each of the sub-test was administered on boys and girls studying in standards V, VI and VII. To avoid biased sampling the schools situated in different localities which would - include children from all the strata of the society. They roughly included all the economises, social and intellectual levels.

The following table shows the names of schools, locality and the number of students tested.

TABLE

| Name of the School | Locality | No. of Students |
|---|--|-----------------|
| L. Manilal Sunderji Muni- cipal School, Vile Parke, | Vile Parle | 100 for each |
| 2. Pupils' Own School, Khar | Khar | 11 R |
| 3. Lilawanti Kabubai High School, Sandhumst Road, Bombay. | Sandhunst R b ad & Girgaum | B II |

All the sub-tests were separately administered to 100 students of each standards. They included both boys and girls.

Time Limit :

As our main purpose of try-out is to collect accurate data about each item, it is extremely important that there should be no time-limit so as to permit all the students to attempt every item on which pre-tryout data are desired. However time taken by each student to complete each sub-test was recorded on the right-hand top corner of the test-sheet.

The average time taken by pupils for each sub-test was calculated. On the basis of this the approximate time limits for each of the tests under construction were determined.

Scoring :

Before administering the test the method of scoring was determined. The test was then scored according to this pre-determined method. Items were not given any weightage from the view point of either the estimated difficulty or importance. Each correct response carried one point. No formula for correction was applied in scoring. Total number of students giving right answers and the total number of students giving wrong answers for each item of each sub-test were — found out.

Scrutinising of Items :

Pre-try out was carried out on a small sample with a view to having a rough estimate about the working of each item. The total score of each examinee was of very little interest at that stage. The number of students giving correct responses and wrong responses for each item gave directly — the percentage as the total number of students tested was one hundred. This was useful to find how difficult the items were. Except a few items of the two extreme levels, items having — very high percentage or very low percentage of correct res — ponses were discarded. Majority of the items selected were from the middle level.

Modification of Items:

The faulty items were rejected. However, there were a number of items which were modified so as to become better items than what they were at the beginning.

Test Booklets for Pilot Testing :

The revised matter was printed in the form of booklets for all the 18 tests.

The following points were bourne in mind while preparing test booklets:

- 1) The booklets were prepared of such a size as would provide ample space for proper arrangement of the types.
- 2) The cover page of the test was solely reserved for directions and personal information about the pupils.
- 3) Score box was provided on the cover page.
- 4) Each test began on a fresh page
- 5) All the necessary modifications and omissions in instructions and items were carried out.

In all five hundred copies of each of the 18 tests were printed.

They are given in Appendix.

CHAPTER IV

PILOT TESTING

After the gross deficiencies in the tryout forms had been eliminated and directions and items modified on the basis of data collected in the pre-tryout, it was essential to obtain accurate information regarding the performance of each and every item in a sample of examinees that would concide with the population about which the information was sought for. So the finished test was administered with a view to knowing how the test would work in its actual use.

The main objects of pilot test are:

- 1. To identify weak or defective items and to reveal needed improvement.
- 2. To determine the discriminating power of each individual item.
- 3. To provide data needed to determine appropriate time limits for the finished test
- 4. To identify non-functioning or implausible distractors in multiple-choice items.
- 5. To determine the number of items in the test.
- 6. To determine the difficulty of each individual item to facilitate selection of items.
- 7. To determine the needed improvements in the process of administering the test.

Sampling :

The data collected in the pilot testing would be helpful to determine the quality and nature of the test items
with respect to the population on which the name to
be fixed later on. The sample used for pilot testing should
naturally coincide with the sample of the ultimate population.
These 18 tests were administered in three schools in the city
and suburbs of Bombay, which would be considered to fairly
represent the whole city. Each test was administered to 370
students studying in standards V, VI and VII

机分子的 医内侧 病性 医原丛

Lindquist E.F. Editor "Educational Measurement" American Council on Education, Washington D.C. 1955. 2 P.250-251.

Administration:

The tests were administered either in the months of March and April or in June and July. A standard procedure was fixed in the beginning for able administration of the rilot Tests.

Before the test booklets were distributed, the students were addressed as follows for proper motivation.

To-day, you are going to have a new type of test.

The purpose of this test is to tell us something about the general educational development. We want to know your attainment in different subjects. The information will help us to know the standard of the school as a whole and will show how it compares with other high schools in the city. Over and above what we learn about you, it will help us to know your — individual needs too. The results can be useful to all of us only if each of you put in best efforts in the tests. When you will see the tests, you will really enjoy them. They are so interesting."

Thus, after proper motivations, the following instructions were given:

"I shall now pass on the test-booklets. Do not open them. As soon as you get the booklet, fill in your name and other informations on the cover page. Also read the directions which are given on the cover page. Do not open the booklet until you are told to do sok"

Then the booklets were distributed to all the students. Sufficient time was allowed to fill in the necessary information and to read the instructions. They were asked to put question - regarding the tests. All the doubts of the pupils were cleared.

Then, the following instructions were given.

"When I say 'begin' turn the page and begin to write down. There are different sub-tests, in the

booklet. Complete directions with illustrations are given for each sub-test. Work as its as you can. Sufficient time will be given to you provided you do not waste your time. As soon as you finish all the sub-tests, raise your finger."

Then the students were asked to begin.

Phis standard procedure was used by all the Research posistants for all the 18 tests in the three standards.

The following schools were selected at randum for Pilot testing. They were selected from different areas of the city. They included both Municipal Primary Schools as well as Secondary Schools, and also the number of students.

Scoring :

There are two important factors which require proper attention to decide the procedure of scoring. These factors are:

1) Weighting (2) Correction for guessing

1) Weighting

In school subjects there are several * pics which are more important than the others. More attention may be paid the paid to t

When different weights are alloted to items the scoring work becomes complicated, labourious and slow. Ross suggests "The scoring procedure adopted should be fairly simple. As a rule, the best procedure in scoring objective tests is to give one point of credit for each correct response. It is unnecessary to weight the items according to estimated difficulty or importance. Almost all pupils will be in the same rank order regardless of the weighting of the — individual items. "

There is a good evidence of research works which were carried out by Douglass and Spencer, Petthoff and Barnett and other investigators. They have established the fact that "the correlations between weighted and unweighted scores objective tests tend to be vary high." The correlations between weighted and unweighted scoring were approximately of to of the experiments. According to Petthoff and Barnett, "the difference between weighted and unweighted

s may be considered to be so small that it may be "Measurement in To-day's Schools"

Frentice-Hall, Inc. 1956. P. 156

^{3.} Lindquist E.F., "Educational Measurement" American Council on Education, Washington D.C. 1955. P.370

disregarded, and a great deal of labour may be dispensed with by using the unweighted scores in determining the little grades."

Stalanker Substantiates the fact thus: the relationship between weighted and unweighted scores is so high, so nearly perfect that there is little justification for the use of weights with these examinations.

In the present experiment, considering the above views no weightage to items was alloted. One point was given for each correct response of the item.

2) Correction for guessing :

In recognition type-tests, pupils have to select a response from the suggested responses. So, there are possibilities of guessing in the true-false tests, the multiple - choice tests and the matching test. Therefore, it should be decided whether the scores are to be obtained by adding the responses or whether a formula to correct for guessing and chance factors is to be employed. The formula for correcting for guessing is

$$s = R - \frac{W}{O - 1}$$

where S = Score

R = the number of right responses.

W = the number of wrong responses.

O Z the number of options for a single item.

As there are two options in true-false tests, the formula assumes the form S = R - W. For three option item of multiple choice tests, the formula is S = R - W. For four option item, the formula is S = R - 1/3 W, and so on.

^{4.} Ibid P. 370

⁵ Ibid P. 370

For the true-false tests, the formula S - R - W minimises the errors due to guessing. But the correction formula becomes meaningful only for 75 or 100 items. So Menzel 6 warns that there should be atleast 100 items in the test to eliminate the unreliability arising from mere chance and guest work. He further supports the fact. "It can be assumed that in the long run about half will guessed right and half wrong. The longer the test the more certain we may be that the above assumption is correct. For, the law of averages, applies to a large number of trials and is not at all reliable in a small number of trials." 7

For multiple-choice tests, Ross 8 suggests that it is desirable to have items with the same number of choices, whe the correction formula is to be applied.

For matching tests. Lindquist 9 is not in favour of correction formula. Ross substantiates the fact," if the item have six or more options, it is probably not worth while to correct the 'rights' score for chance." 10

In general, Micheel and Karnes opine, "There does not seem to be much evidence to indivate that the informal type test is significantly improved by correcting for guessing The authors are of the opinion that little is to be gained in using correction formula." 11

In the present experiment, considering (1) the number of items in true-false tests, (2) unequal number of options (3) items of multiple-choice tests and (3) the views of the above research workers, no correction formula is applied for scoring.

Examinang and Arranging the Test-booklets:

All the 570 booklets of each standard were examined giving one point for every correct response.

Those booklets were arranged in descending order of score, i.e. one with the highest score on the top and one with the lowest score at the bottom. These booklets were then num - bered from 1 to 370.

The selection of items for the final run is based partly on detailed specification of the content and partly on statis tical characteristic of each item. There are two main statis tical aspects of the individual item. (1) the difficulty level (2) the discriminating power.

Kelley ¹² has shown that the most accurate determination of item validities or internal consistencies can be obtained by comparing approximately the upper and lower 27 percent of the total group.

For such statistical purposes, the test-booklets were divided into three groups :

- 1) The upper group [called U [27% booklets i.e. 100 booklets, 1 to 100
- 2) The middle group (called M (46 % booklets i.e. 170 booklets 101 to 270
- 3) The lower group (called L (27% booklets i.e. 100 booklets 271 to 370.

Evidently the U group represents good students while the L group represents weak students.

The percentage of students in each group answering each item correctly was calculated. As there were 100 students in "U" and "L" groups. The number of students answering each item correctly gave the percentage directly.

¹² Kelley T.L., "The Selection of Upper and Lower Groups for the Validation of Test Item," J.Edu. Psychol., 30 17-24 (1939). Quoted by Thorndike R.L., "Personnel selection," Jhon Wiley & Sons Inc. Newyork. 1949 P.345

i) The Difficulty Value:

There are different methods to compute the item difficulty indices. The most popular oneis based on the extreme acores of the distribution.

The following formula is generally used to find the difficulty values.

where D is one Difficulty value

U is the percentage of students scoring the liter correctly in the upper group.

L is the percentage of students scoring the item correctly in the lower group.

In this experiment, this very method was used for all the 18 In the above method, middle 46 % test-booklets were tests. not taken into consideration. Naturally, it will raise some doupts about the reliability of the method. There is an exportmental evidence. "The writer has computed the reliability co-officient of group of typical item difficulty indical estimated in blue way. It was found to be .98 when the sample included 100 examinees in the highest 27 percent and 100 examinees in the lowest 27 percent." 13

In the present experiment, 370 cases were taken for pilot testing. 27% of 370 cases give 100 cases for the upper and lower groups.

Validity and Discriminating Fower of the Items :

Items must be able to discriminate the achievements of various pupils. K. Bean defines The discriminating value of an item as "the degree to which any single item separates the superior individuals from the inferior ones in the trait being measured. 13 There are several methods of determining the descriminating Powers of an item. The following methods

are used in the present project. 13 Bean K.L. "Construction of Educational and Personal W/8 Tests" Megrow Hill Book Contany, New York 1963 P. 153.

i) First Method:

The reliability of the discriminating power of each item was also determined by the use of the formula V = U-L.

Naturally, if an item is discriminative the batch of the brighter students (i.e. U group) will correctly solve that item more frequently than the batch of the weaker students - (i.e. L group). If an item is not discriminative, the batch of brighter and weaker students will correctly solve that item approximately in equal proportions. It also happens that L group pupils correctly solve the item more frequently than the U group pupils, in the case of negative discriminative items.

ii) Use Flanagan's Tables

rlanagen 15 has prepared a table for estimating product moment correlations. In this method the discriminating value of each item is calculated by finding the percentage of correct responses of each item in the upper and lower groups and reading the value directly from these tables. These tables were used for determining reliability of the discriminating value of the item in the present experiment.

iii) Use of Nomograph to assign discriminating value to lest Item:

Lowshe has developed a nomograph that can be used to assign discriminating values to individual test items. This nomograph has been used for this purpose in the present experiment.

The following tables show all these values of all the 18 tests of the present experiment.

¹⁵ Thorndike R.L. Personal Selection Test and Measurement Tachnique" John Wiley & Sons; Inc. 1949; P. 345

Tables showing U., L., and the Difficulty, Values, validity and Discriminating power of the items by the different methods used in the Experiment.

*** *** ***

Item Selection :

Lindquist suggests that the following principles should be observed while selecting the items for the final run.

- (1) A difficulty index should be computed for each item.
- (2) A discrimination index should be computed for each item.
- (3) The numbers of items desired at each level of difficulty should be estimated.
- (4) All the tryout items should next be separated into groups indicated in the outline of the test. From each separate group, a number of items should be selected tentatively that will be roughly proportional to the weight given to each division in the test outline and that will create approximately the proper distribution of item difficulty indices.
- (5) The entire group of test items should be read over as a unit to detect unnoticed overlappings of choices and to prevent cross-keying of items.

^{1.} Lindquist E.F., "Educational Measurement" American Council on Education, Washington D.C. 1955. P. 313-315

- (6) The choice-by-choice item analysis data for each item should be studied.
- (7) The items should be grouped approximately arranged in order of difficulty.

In the present experiment, the following points were considered critically at the time of selecting the items.

- (a) The difficulty level.
- (b) The item validity.
- (c) The discriminating Power.
- (d) The distractors of multiple-choice test.
- (e) The curricular validity.

(a) The difficulty Level:

It is a mathematical fact that an item of 50% difficulty level is the most discriminating one. But to propage of the items of 50% difficulty level is not practically possible.

"....it would be difficult to construct such an examination and it is probable that a test made up of items covering a wider - range of difficulty is psychologically a better measuring device."

Summer 2 suggests the practical solution in deciding the range.

| Item of | diffic | ulty range. | Percentage. |
|---------|--------|-------------|-------------|
| From | 0 | 4O | 20% |
| From | 40 - | 60 | 60% |
| From | 60 - | 90 | 20% |

On the basis of the above montioned range its selection in the president is carried out.

b) The Item Validity:

A good test is that which contains items of high discriminative value. Thorndike suggests, "An item with a validity coefficient as high as 0.25 or 0.30 usually represents an outstanding valid item". 3

In the present experiment, the above criteria is also carried out.

1. Garratt H.E. "Statistics in Psychology and Education." Longmans

2 & 3 (on next page)

(c) The Discriminating Fower:

In order to show that the item has significant discriminating power, Ross has given a table showing the value above which an item can be considered sufficiently discriminating for total number of parisons tested from group 28-30 to 3701-3705.

As 370 students were tested in each of the 18 tests in the present experiment, an extract from that table 4 is shown in the following table.

TABLE No. 97

Table for Determining Whether or Not a Given Test Item Discriminates Signifi-

cantly Between a "High" andma "Low" Group.

| Total Number of rersons Tested | Number in Low or High Group (0.27N) N1= Nh = n | (W1 - Wh at an item can Be Sufficiently D Number of 2 (True false or Two option Multiple Choice) | Cons iscri | idered minati | 1 | <u> </u> |
|--|---|--|---------------|------------------|----|----------|
| والم المنا عمل عمل والم أما مناه أما أما المنا عمل المنا المنا المنا | وجد باب عبد عبد ابت ومع والدر ومن وما والدر وما والدر والدر والدر والدر والدر | Pro onoros | | | | ~~ |
| 369 - 372 | 100 | 13 | 14 | 14 | 15 | |

The items selected in the True-false and Multiple Choice tests for the final run of the 18 tests of the present experiment were such that these values were higher 13 and 14 respectively. For other types of tests, the items of higher Values have been selected.

Thorndike R.L., "Personnel Selection" Jhon Wiley & Sons, Inc, New York. 1949. P. 245.

^{4.} Ross C.C., "Measurement in To-days Schools" Prentice - Hall. Inc. 1956. P. 450.

(d) The Distractors of Multiple-Choice Tests:

It was found that correct responses in several items of the Multiple-Choice tests in the 18 tests of the present experiment were comparatively smaller in some of the distractors.

There were three possibilities in the case of theme items.

- (1) Such distractors might have attracted all the pupils irrespective of the group U, M and L.
- (2) Such distractors might have attracted the pupils of the U group.
- (3) Such distractors might have attracted the pupils of the L group.

It is a fact that if the item is discriminative, except the correct responses, the number of distructors in the U group must be less than the number of distractors in the L group.

All the suggested responses of such items including three option items for the U and L groups were calculated. It was gound that the number of distractors in the U group was larger than the number of distractors in the L group. Hence the distractors had comparatively attracted the pupils of U group. Such items were negatively discriminative. So they were dropped for the final run. In other cases the pupils of L group were attracted by the distractors. Hence such items were discriminative and so they were

selected for the final run.

(e) Curricular Validity:

The test containing the items which satisfy only the statistical requirements, does not fulfill the purpose namely to measure the achievement of pupils in a particular subject for a particular standard. It is obvious that such a test may not cover the whole course giving due weightage to every topic. As discussed in chapter II due watghtage should be given to each of the objectives of standardsV, Vi and VII. Table No. 56 to 73 on pages 50 to 62 show the standard wise specification of contents.

In the present experiment, specification of contents was also considered while selecting the items.

Item selection Technique and the present Experiment:

All the above points regarding item selection are discussed separately. It is not practical to select items keeping the above points separately in view. All these points should be considered simulteneously while selecting the items.

In the present experiment, the following procedure was adopted.

First of all, the statistical data for all the items of all the 18 tests were computeted as given in tables 79 to 96 Items of negative discrimination were omitted for final run.

Items with validity index (r) less than .25 or discridinative value less than 13 were separated from the list.

All the remaining items with their statistical data were distributed in a table from according to objectives.

Items were then selected for the final run keeping Summer's view regarding the difficulty value and curricular validity simultenously.

Some of the items were also selected inspite of their low validity (i.e. below .25) on account of their curricular validity.

It can be understood that it is not possible to prepare a test satisfying all the principles at a time.

The following Tables show the distribution of the selected Items according to Topics in each of the Sub-Tests.

1 2 3 4 5 6 7 8

We have seen in Chapter II that more than one book
was sanctioned as text book by the Education Department of
the State and the different books contained different selected prose passages and poems. Again the different schools
used different books and hence it was not possible to
select items based on actual textual material. However,
the test items selected for the Gujarati and the Hindi tests of all the three standards of the present experiment
are of such a general nature that any one with sufficient
back ground will be able to answer them with ease. At the same
time the material selected is such that it has some bearing
on one or the other sanctioned text book.

In the test items selected it was rather difficult to decide (for the above mentioned reasons) whether to put a particular item in prose or poetry or a Rapid Reader. To avoid the difficulty all the three topics are combined in all the tables showing the selection of items in Gujarati and Hindi for all the three standards viz. VII, VI and V.

Time Limits for the Final Run:

Lindquist suggests that the time-limits in general achievements should be so adjusted that "at least 75 percent of the pupils will have time at least to consider all items in each section" Ruch suggests that time limits should be so fixed that "90 percent can attempt all items within their power". According to Greens, "In achievement testing sufficient time is ordinarily allowed for at a least 80 or 90 percent of the pupil to finish. The speed factor does not receive much weight in the resulting scores. "3" According to Ross

" the time allowance for the test should be generous. Short time allowances should be avoided in order to secure the data needed for determining the difficulty and the discriminating value of the items."

Considering the above views, it was decided to allow leberal time-limits.

The following tables show the time limits fixed for the various tests of this experiment.

The changes after the pilot test

a) Changes in the title page:

It was found that our children were not accustomed with new way of testing. Some children were not serious about answering or even attempting all the items in sub-test. - While others completed the work very haphazardly. Hence instructions were made very clear. These instructions are given on the first page of every test given at this end of the report.

b) Changes in the direction of sub-test :-

In the beginning of every test, directions followed by illustration were given in the right of the experinece of the pilot testing. These directions were altered a bit. Wherever necessary more than one illustration were also given.

c) Other changes:

A few other changes regarding the use of types form of presentation and layout were also made.

Final printing of the test:

After incorporating all the changes mentioned above, the test were reprinted for the final run.

CHAPTER V

THE FINAL RUN OF THE TEST

We saw in the last chapter how the test items in the different tests of Standards VII, VI and V were selected and were arranged accordingly to their difficulty value as far as possible. The sub-tests in each of the tests were also re-arranged wherever necessary and were then printed. These tests are given in Appendix.

Administration of the Tests:

To make the Norms reliable, the school population selected for the final run should be such that it might be considered to be a representative sample of the whole - population.

To select the representative population, the following consideration were kept in view.

- i) School should be selected at randum from the different wards of the City.
- ii) School include schools from the city as well as Suburbs.
- iii) Should include Municipal as well as non-municipal schools.
 - iv) Should include Boys schools, girls schools and . Mixed Schools.
 - v) Should include children from different social economical and cultural strats of the society dwelling in the city.

The following table shows the names of the schools selected at randum for the final run of the tests.

189 Table No. 125

CHAPTER IVI

STANDARDISATION OF THE TESTS

Most standardised tests can broadly be divided into two main categories. (1) School - subject tests (2) Psychological tests. " School - subject tests grow out of the school routine and examine in those things purposely taught in school, namely the knowledge, skills and arts. Psychologigal tests on the other hand aim at the measurement of attitudes, emotions, natural ability, temperament, etc." 1 The present experiment is concerned with the school-subject tests.

To quote Thondike, "Standardised tests do not represent anything new and strange in the measurement of academic achievement. They are blood brothers of the short answer teacher-made tests." No doubt, such tests are expected to be much more elaborate and scientifically prepared than the teacher - made tests.

A standardisation of a test involves the steps of construction, administration, evaluation and interpretation. According to Menzel.3 " A fully standardised test is standardised in three respects: (i) in form and construction (ii) in the way it is administered and evaluated; and (iii) so that the score of any examinee can be quickly and easily compared with the scores of other examinees of the same age, school placement or other classification! According to Ross, 4 a standardised test differs from the informal tests in four essential aspects.

- 1) The content has been standardised;
- 2) The method of administration has been standardised;
- 3) The method of scoring has been standardised;
- The process of interpretation has been standardised
- 1. Menzel E.W., "Suggestions for the Use of New-Type Terr India". Oxford University Press, 1952. P. 40
- 2. Thorndike R.L. Hagen E. "Measurement and Evaluating logical and Education". Jhon Wiley & Sons. Inc. No.
- Menzel E.W., "Suggestions for the Use of New-Type India" Oxford University Press, 1952. P.27.
 Ross C.C., "Measurement in To-day's Schools," Prenti Inc. 1956. P.274-275.

(1) The Content:

As discussed in chapter III and IV, in the present experiment, the items were reviewed and were analysed. The weaker items were rejected. The selected items were arranged in order of difficulty. Thus, the contents were standardised.

(2) The Method of Administration ;

As discussed in chapter V and VI, the time limits for both the tests were fixed. From experiences of the pre-pilot and pilot testing, adequate changes in (1) the general directions (2) directions for sub-tests (3) the method of recording the responses in multiple-choice tests and other modifications regarding types, printing, spacing etc. were introduced. In this way, the method of administration as standardised.

(3) The Method of Scoring :

Before the scoring-work begins, the answer keys and the manual of directions would be prepared.

a) The preparation of Answer-Key :

Answer key should include all the correct responses to make it complete and exect. Answer keys for all the tests were prepared by studying the responses of the pupils - from the pre-pilot and pilot testing. Answer keys for all the tests are reproduced in appendix ...

b) The Manual of Directions:

Regarding directions to the experiment and to the subjects, fill Equipment and to the subjects, fill Equipment and the subjects, fill Equipment and the subjects and the subjects of standard tests should recognise the importance of adequate, but not - cumbersome, directions and of determining by experimental procedures the best directions before marketing their products. 5

^{5.} Lindquist E.F., "Educational Measurement" American Council on Education, Washington, D.C. 1955. P. 351-352

As suggested by Lindquist, Special attention should be given to the following criteria while writing the directions for the administration of the test.

- 1) Assume that the examiner and examinees know nothing at all about objective tests.
- 2) In writing the directions, use a clear succinct style.
- 3) Make the more important directions stand out through the use of different sizes and styles of type.
- 4) Give the examiner and each proctor full instructions concerning what to do before and after the test is given as well as during its administration.
- 5) Check on all possible misunderstandings and inconsistencies.

Administrator of a test must have at hand a list of procedures to be followed in preparing for the test, during the test and after the test has been given.

From, the experiences of the pre-pilot and pilot testing the manual of directions for the tests was prepared. It is reproduced in appendix

c) The Actual Scoring:

The answer-keys thus prepared were reproduced in the _ blank booklet of each test. Then strips of answer-keys were out from the booklet and was pasted on a card-beard. Naturally, these strips of different sub-tests contained as much spacing between the answers as in the pages of booklet. The test-book-lets were examined by superimposing the key-strips on the answer-papers.

All the 18 test booklets of Standards V, VI and VII in all the subjects were examined, assigning one point to each correct response. Scores of correct scores for each sub-test were noted on the front page of the booklet. By adding the 6. Ibid P. 352

score obtained in each subject, the total score obtained by each subject were found out.

4) The process of Interpretation:

Normsaare of great value in interpreting the scores. Flanagan's opening sentence regarding norms is highly pertinent. "Test scores are meaningful and valuable to the extent that they can be interpreted in terms of capacities, abilities and accomplishments of educational significance."

There are following main types of norms:

- (a) The age norms; (b) The school-gradue norms;
- (c) The percentile norms; (d) The standard score nprms. Among these No. (d) is the derived score.

(a) The Age Norms:

The age norms are very useful in psychological tests. But the achievement of a pupil in a particular subject is - affected by many factors other than age. "Tests intended for use in the secondary school are more frequently provided with percentile and grade norms only. Age norms do not seem to be particularly useful at the high school and college levels, - since so many factors other than age operate to affect achievement. "8 As the present experiment deals with achievement tests, age norms are not useful.

(b) The School-grade Norms:

As there are separate tests for standards V, VI and VII in the present experiment, the question of fixing the school-grade norms is out of focus.

(c) The Percentile Norms:

A percentile norm is an estimate of a population percentile. Percentile norms interpret a pupil's score showing 7. Ibid. P. 695

^{8.} Greene H.A., Jorgensen A.N., Gerberich J.R. "Measurement and Evaluation in the Secondary School," Longmans Green and Co., 1955 P. 95

his position in the group in terms of the percent of pupils.

Ross ⁹ mentions the two limitations of percentile norms neither of which is usually very serious for most purposes.

- (a) The scale values are unequal in length;
- (b) The percentile values in one grade or age group are not easily comparable with those in another.

In the present experiment, the question of comparing one grade or age group with another does not arise. Accordingly, the percentile norms for both the tests were computed.

(d) The standard Score Norms:

Standard scores are also known as sigma scores or Z - Scores. "These units are expressed in terms of the mean and standard deviation of the typical age or grade or, for that matter, of any group. "" Ross quotes Thurstone:"..... standard scores or percentile scores yield much more information even for young children." 10 According to Lindquist, " Such scores simplify interpretation and increase comparability." 11

In the present experiment, the standard scores for both the tests were computed.

Separate Norms:

Place and sex affect the norms. Sometimes, separate norms for urban and rural areas and separate norms for boys and girls are also calculated."..... separate norms for rural and urban areas are also determined to show the effect of varying environments. If the sex difference is found to be appreciable, separate norms for boys and girls are also fixed. 12. Such separate norms are useful in the case of some psychological tests. — Menzel is not in favour of separate norms for school-subject. tests.

^{9.} Moss C.C., % Measurement in To-day's Schools, Prentice-Hall, Inc., 1956. P. 295

^{10.} Ibid P. 290

^{11.} Lindquist E.F., "Educational Measurement" American Council on Education, Washington D.C. 1955. P. 723.

^{12.} Desai K.G., "The Construction and standardisation of a Baltery of group Tests of Intelligence in Gujarati." Bharat Prakashan, Ahmedabad, 1954, P. 101

His argument is, ".... in school subjects" there has not been any consistent difference between the sexes large enough to be taken into general consideration. "13 He further adds, "There is talk of having rural and urban norms, for in certain things the city children do have an indisputable advantage. In India where the city monopolizes such a large percentage of the educational groups and the rural areas are backword, a different standard will probably be considered only natural when we realise the handicaps of rural children." 14

Considering the above views separate norms for boys and girls, for urban and rural areas were not computed in the present experiment.

The Measures of Central Tendency:

Norms are given by the central tendency of the group.

There are three measures of central tendency.

- (1) the mean (2) the median (3) The mode.
- Of these, the mode is an unstable measure and therefore it is not reliable. Therefore, the mode is not computed for both the tests in the present experiment.

The following tables show the frequency distribution of the boys, the girls and the total population for standards V,VI and VII for the different subjects.

The following tables show the Frequency distribution of the Total sample (Boys and Girls together) in the various Tests for the standards namely Std. V, VI and VII

| uartile Deviation | T(0)4 | T 1003 | | |

It can be seen from the above tables that in most of the cases :

- The mean of the whole group is nearly half 1) the total No. of items.
- The Mean and Median are very near each other. 2)
- The Means of Boys and Girls fluctuate considerably 3) so that it is not possible to come to any decisive conclusion whether Boys are superior to Girls or Vise Verse.
- Standard Deviation is nearly 1/6th of the total No. of items approximately.

The Percentile Norms:

The percentiles of the frequency distribution of the total group as well as Boys and Girls separately computed, using the formula given by Garrett H.E. "Statistics in Psychology and Education" Longmans Green & Co. New York 1951. P. 78.

Tables showing Jertain percentile of the whole group (Boys and Girls to-gether) in the Frequency Distribution of the various tests for Standards V, VI and VII in the first Experiment.

CHAPTER VII

THE RELIABILITY AND THE VALIDITY

The Meaning of Reliability and Validity:

Reliability means the degree to which the test agrees with itself. According to Greene, "A test is said to be reliable when it functions consistently. The reliability of an examination depends on the efficiency with which a test measures what it does measure."

 $\ensuremath{\varLambda}$ test is said to be valid when it measures what it attempts to measure.

In short, validity is concerned with its truthfulness, while reliability the concerned with its consistency. So, it is possible that a test may be highly reliabe, but not at all valid. "A test may be reliable without being valid, but that it cannot be valid unless it is reliable. Therefore, reliability is really an aspect or a phase of validity." 2

Methods of Determining Reliability :-

There are a number of statistical procedures for determining the reliability of a test. The following methods are in common use to determine the reliability of a test:

- 1) The alternate or parallel forms method;
- 2) Thei test-retest method;
- 3) The split-half method;
- 4) The method of 'rational equipalence.'

^{1.} Greene H.A., Jorgensen A.N., Gerberich J.R., "Measurement and Evaluation in the Secondary School." Longmans, Green and Co., New York. 1955. P. 72

^{2.} Ibid. P. 72.

1) The Liternate or Parallel Forms Method:

In this method, two separate parallel forms are prepared, the same group is tested with these two equivalent forms under a similar procedure, within a short interval of time to guage the reliability. It is natural that if a test is reliable, a pupil scoring high marks in the test, also scores high in the equivalent form. The scores on two equivalent forms are correlated and the coefficient of correlation is computed.

Objection :

It is difficult to prepare two equivalent forms. It is possible that the two equivalent forms, prepared, may be indentical only in procedure and not in content. There is also a danger of overlapping of items in the two forms. - Lindquist states: "In preparing equivalent test forms there is danger, on the one hand, that the two tests will vary so much in content and format that each will have some specific variance distinct from the other, in which case the correlation between the two will under estimate the reliability. - There is the reverse danger that the two forms may overlap to such an extent in paperific details of content that variance due to specific sampling of content may be common to the two tests. In that case, the variance will be treated as - systematic rather than chance variance, and the obtained correlation will over estimate the reliability." 3

2) The Test-Retest Method :

医毛红色医结膜 医多种性多种

In this method, the same test is repeated to the same group under a similar condition at a later time. The two series of scores, thus obtained, are correlated and the coefficient of correlation is computed.

^{3.} Lindquist E.F., "Educational Measurement" American Council of Education, Washington D.C., 1955. P. 575.

Objections :

- (1) It is difficult to administer the same test twice under a similar condition.
- (2) If the retest is administered after a short interval of time, the practice and memory affect the scores, Because of familiarity, the increase in score is very likely.
- of time, the score is affected by other factors like maturity growth etc. "In the case of achievement tests, particularly this delay is likely to introduce other variables. The pupils may discuss the test between trials, do extra study, or do other things that may effect a change in the status of their knowledge. In addition to this, their physical and mental conditions fluctuate from day to day, even from hour to hour."

According to Greene, In any event, some increase of scores will probably result from the practice-effect." 5
Co-efficient of correlation, obtained by this method, is -generally high.

3) The Split - half Method:

The first method needed two equivalent forms to administer them to the same group, and the second method needed to administer the same test twice to the same group at a suitable interval of time. "In the interest of economy, it become desirable to set up procedures for extracting an estimate of reliability from a single administration of a single test."

In split-half method, a test is administered once only. The test is split upk into two equivalent parts and the co-efficient of correlation between them is computed. This gives half test reliability. From the half-test reliability, the self-correlation of the whole test is determined by applying the Greene H.A., Jorgensen A.N., Gerberich J.R., "Measurement and Evaluation in the Secondary School," Longmans, Green and Jo., New York, 1955. P. 73.

6. Lindquist E.F., "Educational Measurement," American Counce of Education, Washington, D.C. 1955. P. 579.

Spearman-Brown formula. ".... its main advantage is that all of the data for determining test reliability are obtained upon one occasion, hence variations introduced by differences between two testing situations are eliminated." 7

Objection:

The test can be divided into two halves in a variety of ways. So, co-efficient of reliability is not a unique - value. "This criticism is strictly true only when items are of equal difficulty when items are in strict order of merit from least to most difficult, the split into odds and evens gives a unique determination of the reliability coefficient."

According to Greene, 9 this is one of the most feasible methods for use with informal objective examinations for which ordinarily no second or alternate form is available.

4) The method of 'Rational Equivalence':

In this method, the information about consistency of performance from item to item within the test have been utilised. It is free from the objections raised against the above three methods. Kuder and Richardson have devised a formula popularly known as K - R 20 to estimate the reliability of the test. But the formula is very complicated and demands laborious calculations. This formula is modified by several research workers. One of the most useful and popular formulas 10 is as follows.

$$\mathcal{T}_{11} = \frac{n}{(n-1)} \times \frac{\sigma_{L}^{2} - \epsilon \beta V}{\sigma_{c}^{2}}$$

in which :

た。= reliability coefficient of whole test;

 γ_1 = number of items in the test;

The S.D. of the test scores;

the population of the group answering a test item correctly;

V = (1 - h) The proportion of the group answering a test item incorrectly.

The Reliability of the present experiment:

The reliability of the present experiment has been computed by only one method viz. the split half method.

As mentioned above, it is difficult to prepare an alternate form of the test. "If only a single form of a test is needed for the research or practical use to which the test is to be put, it often seems unduly burden some to prepare two separate tests merely in order to obtain an estimate of reliability." Under the circumstances, it was not thought worthwhile to prepare an alternate form and so this method is not used in the present experiment to gauge the reliability.

1) The split half method:

Three schools were selected at randum and coefficient of coefficie

11. Lindquist E.F. Washington, D.C., 1955 P. 579.

(2) The Method of Rational Equivalence :

The reliability coefficient was computed by the above method using the formula:

The following table gives the results obtained.

TABLE No. 173

The table showing results of reliability coefficient obtained by the method of Rational Equivalence.

The Index of Reliability:

"An individual's "true score" on a test is defined as the mean of very large number of determinations made of the given person on the same test or parallel forms of the test administered under approximately identical conditions. "12 The correlation — between a series of obtained scores and their corresponding theoretically "true" scores was found by the formula:

in which,

the reliability coefficient of the given test

the correlation between obtained and true scores.

The indes of reliability represents the maximum correlation which the given test is capable of yielding between the obtained and the true scores.

12. Garrett H.E. "Statistics in Psychology and Education, Longmans Green and Co., 1951. P. 391.

The following table gives the index of reliability of the eighteen tests for the Std. VII, VI and V

| | | | |

The reliability of the mean and the S.D.

The Standard errors of the above statistics have been computed and are given in the previous chapter along with these statistics.

The reliability of the sample:

had been selected for the purpose of testing at various stage. These were taken at random. These inbludedpthildren from all the strata of Society. The schools situated in almost every Municipal ward were included in the sample. Hence the sample be considered as fairlyly representative of the population. However, the Chi-squared test for goodness of fit does not give satisfactory result for some of the test. This may be due to the poor or extra ordinary teaching in the respective schools subjects; because it has been found that the teaching efficiency in different schools was different and depended on various factors which need not be discussed here. However, looking the results /the tests the sample is fairly reliable.

Validity of the Tests:

In some respects, the validation of an achievement terismore difficult than the validation of an intelligence test

and a greater number of procedures are employed for its determination. "13. In discussing the validation of achievement test the following aspects should be considered.

- (1) The curricular validity;
- (2) The Statistical validity.

The Curricular Validtty:

To establish the curricular validity, the syllabus of -various subjects of Stds. VII, VI and V, nearly all the Gagerationt extebdoks reachtioned by the Education Department of
the old Bombay State, weightage assigned to the different -topics in each subjects of each standard by the experienced
teachers keeping in view the teaching periods and the weight
to these topics in the question papers set at the annual exc
nations and the total No. of pages allotted to each topics i
the text book writers have been critically studied. This stuis discussed elaborately in Chapter II. The Blue Prints of
this have been given there.

The Statistical Validity:

"Statistical validity refers to the mathematical process for determining the degree to which the test agrees with, or correlates with, some criterion which is set up as an accept measure of the thing in question. Some of these statistical procedures aim at validating the test as a whole and others validating the items individually." 14

(1) The practical validity:

The pracitical validity of the tests can be checked by

- (a) the school examination marks of the subjects,
- (b) the teacher's rating

13. Ross C.C., "Measurement in To-day's Schools", Prentice Ha. Inc., 1956 P. 111. (14) Ibid. P. 112

2) Pro internal velidate by computing the inter correlations.

The Annual Examination Marks:

It is a fact that the present examination are highly subjective. The marks obtained at the annual examinations as not so reliable. The pupil's score also depends upon the national of question paper, the mood of the examiner and such other factors. "Inspite of the apparent unreliability of teachers marks for refined measurements, an educational test that consistently picks out the pupils who, in the teachers' judgement of a specific ability, are superior or inferior probably dehave significant validity." 15

Marks from three different schools in each of the subjects obtained by the candidate at the annual examination in standard VII, VI and V were collected. These were correlations the product-moment formula. The results of these correlations are given below:

b) The Teachers' Rating :

Each of the subject teachers teaching in the three classes of the three schools selected for the purpose of Reliability and Validity, was requested to estimate the pupils' proficience in the subject and rank them accordingly to their achievement. The test scores of the pupils were correlated with these recusing the Rank difference formula in the second state.

The following tables give these correlations.

TABLE No. 178

Coefficient of Correlations between the Teachers estimates and scorosson the tests using Spearman's Rank different method.

The Internal Validity:

"The validity of a test also depends upon the team-work of the sub-tests. The a valid test, all the sub-tests show a gor correlation with the whole battery." 16

^{16.} Desai K.G. "The Construction and Standardisation of a Bettary of Group Tests of Intelligence in Gujarati".
Bharat Frakashan, 1954; P. 186

In the present experiment, the test booklets of the same three classes referred to above were taken and the coefficient of correlation of scores in each of the sub-test with the total scores in the whole test were correlated using the Product moment formula. The following tables give these results.

TABLE No. 179

| 5td | 0 | V | I | I |

| А | | ი. გა | - | - | 4 | - 10 |

TABLE No. 181

Std. V

| Sub | Gujarati | Hindi | Subject Arithmetic | History | Geography | Science |
|-----|----------|-------|-----------------------|---------|-----------|---------|
| 1 | 0.64 | 0.77 | 0,81 | 0.56 | 0.66 | 0.72 |
| 2 | 0,71 | 0,82 | 0.84 | 0,61 | 0.67 | 0.81 |
| 3 | Ü.71 | 0.74 | 0.76 | 0.72 | 0.71 | 0.73 |
| 4 | 0.83 | 0.68 | 0.61 | 0.66 | 0.72 | 0.63 |
| 5 | 0.82 | 0.71 | 0.75 | 0.59 | 0.55 | 0.64 |
| 6 | 0.77 | 0.31 | 0.59 | 0.65 | 0.49 | 0,81 |
| 7 | 0.69 | 0.73 | 0.81 | 0.49 | 0.56 | 0,73 |
| 8 | 0.72 | 0.77 | ₩ | 0,53 | 0.62 | • |
| | | | | | | |

It can be observed from the above tables that all the correlation with the exceptions of very few are above 0.50 which shows that all the sub-tests are in good agreement with the whole test in each of the subject of Std. VII, VI and V. Hence it can be observed with confidence that all the tests are valid.

Conclusions:

A glance at the above tables which show the Reliability and Validity computed by using different methods show that all the tests are both valid and reliable.
